

As a mid-stream gas processing corporation, safe reliable operations at our processing plants with maximum run times are key business needs. *Resistant Lining Ltd.* has been successfully used in helping us protect our storage tanks and pressure vessels when internal coatings are required. Richard and his *Resistant Lining* team have been called upon to inspect, advise and apply internal coatings in the past and continue to be a valued service provider.

Our demands are two fold, the products' service life and the quality of workmanship. The typical application window that *Resistant Lining* is asked to work in are during scheduled shut downs (Turnarounds) to which time and cost management are critical to successful project executions. Resistant Lining has been reliable, getting the job done efficiently and effectively in the time required.

*Resistant Lining* has always met our criteria for safety responsibilities to all workers on site, environmental stewardship requirements in product handling to sandblasting, and finally the end quality of the product. Achieving and maintaining these standards requires a corporate discipline: in hiring the right person, mentoring with training and providing them with properly designed and maintained equipment. Richard and his team have never disappointed us.
